FICTIONAL DOCUMENT FOR SOFTWARE TESTING. NOT REAL DATA.

Protocol ZX-204, Section 9: Statistical Considerations

9.1 Sample size. A total of 240 participants (120 per arm) provides 90% power to detect a difference of 25 percentage points in PASI 75 response at Week 12, assuming a placebo response of 10%, using a two-sided alpha of 0.05.

9.2 Analysis populations. The primary analysis uses the intent-to-treat population. Missing data will be handled by non-responder imputation.

9.3 Multiplicity. Key secondary endpoints are tested in a fixed sequence: sPGA first, then DLQI.
